The Power Series V4.2+ Now Supports Menu Driven Programming

Power Series V4.2+ control panels with Programmable LCD PK5500 V1.1+ keypads now support Menu Driven programming. This is very similar to the Maxsys PC4020 programming.

Menu driven programming is useful when the installer is programming the system and doesn't have the installation manual or, doesn't know the proper programming sections off hand. Menu driven programming will also lower your need for technical support as all the programming options are laid out in English menus, grouped together in a logical sequence.

While in programming, press Keypad Panic for two seconds and the PK5500 or RFK5500 keypad will switch to Menu Driven programming mode. While in this mode, [*] selects a menu, and [#] exits a menu. The keypad will stay in this mode until Keypad Panic is pressed again for two seconds to go back to Sectional Programming mode.
